

Wanderlust — Browsing Listings & Making Bookings

Searching for Listings

Wanderlust supports both keyword-based and semantic search.

- Use the search bar to look up destinations, property types, or amenities (e.g. "beachfront villa with pool").
- Wanderlust's semantic search (powered by MongoDB Atlas Vector Search with local embeddings) understands the *meaning* of your query, not just exact keywords — so natural phrases like "quiet mountain cabin for a weekend getaway" will surface relevant listings even without exact keyword matches.
- Filter results by location, price range, and category from the search page.

Viewing a Listing

- Each listing page includes photos (hosted via Cloudinary), a description, location shown on an interactive map (via Mapbox), pricing, and reviews.
- Click on the map to see the exact area of the property; precise addresses are shared only after a booking is confirmed, for host privacy and safety.

Booking with the AI Assistant

Wanderlust includes an AI booking assistant that can help you find and reserve listings conversationally.

- Simply describe what you're looking for (dates, location, budget, preferences) and the assistant will suggest matching listings.
- Before finalizing any booking, the assistant always pauses at a **confirmation step** — it will summarize the booking details (listing, dates, price) and explicitly ask you to confirm before the reservation is created. No booking is ever made without this explicit confirmation.
- You can cancel or change your request at the confirmation step if the details aren't right — just tell the assistant what to change.

Manual Booking (without the AI assistant)

- From any listing page, select your dates and click "Book Now."
- Review the booking summary, then confirm to complete your reservation.

Managing Your Bookings

- View all upcoming and past bookings from your Dashboard.
- Booking confirmations include the listing details, dates, and total price.

Common Issues

Issue	Likely Cause	Resolution
Search returns unrelated results	Very broad or ambiguous query	Try adding more specific details (location, dates, amenities)
Map not loading on listing page	Temporary Mapbox load issue	Refresh the page
AI assistant didn't book after I described what I wanted	This is expected — it always asks for explicit confirmation first	Reply "yes"/"confirm" to complete the booking
Booking not showing in dashboard	Page cache	Refresh or re-login
